

Project Title: Baraqah – FoodPool

Student Name: Salman Ejaz

Roll Number: BSAI24067

GitHub Repository: <https://github.com/lackadaisicALMAN/Baraqah-App>

1. Current Progress Overview

The project is currently transitioning from the design phase to the initial development phase. The core architecture has been finalized, focusing on a hybrid database approach to manage real-time social interactions and transactional integrity.

2. Tasks Completed

- **System Architecture Design:** Defined the flow for "Dining Sessions" and the "Baraqah Score" reputation system.
- **Tech Stack Finalization:** Selected Flutter for cross-platform mobile access and a Node.js/Python backend for handling matching logic.
- **Database Schema Mapping:** Completed the relational schema for PostgreSQL (Users, Restaurants, Sessions) and document structures for MongoDB (Reviews).
- **UI/UX Wireframing:** Developed high-fidelity slides and initial wireframes for the user journey (Joining a table, scanning QR for check-in).
- **Repository Setup:** Initialized the GitHub repository and established the project structure.

3. Remaining Features to Implement

- **Matching Algorithm:** Implementation of the Python-based logic to match users based on food preferences and "Baraqah Score."
- **Real-time Notifications:** Setting up Redis to handle instant alerts for group dining requests.
- **QR Check-in System:** Developing the session-based QR validation to prevent "dine-and-dash" scenarios and ensure attendance.
- **Bill Split Logic:** Coding the flexible percentage-based split calculator (50/50, 70/30, 100/0).
- **Deployment:** Final hosting on a live server and publishing the .apk to the Play Store for mandatory evaluation.
